MACROECONOMIC THEORY

 $m ster \ 1 \ 2022/23$ 

e: 18 January 2023, 2:00 pm e: 20 January 2023, 2:00 pm

#### INSTRUCTIONS SPECIFIC TO THIS EXAM:

• Answer **ONE** question from Section A and **TWO** questions from Section B. Each section is worth 50 points.

- You must submissigles has held the Handfurtences penses at not acceptable. Any equations must be typed. However, hand-drawn diagrams are acceptable, as long as they are included within the main document of your submission.
- You must submit Mall swell to ICS Word Hower of M PDF.
- Ensure that any included diagrams are oriented correctly. Marks will be deducted if your diagrams are rotated 90 degrees, upside down, etc.
- Do not submit an image of typeset answers. Do not include equations by inserting pictures of equations.
- Students are not permitted to discuss their answers with other students before submission. https://tutorcs.com
- Candidates are expected to demonstrate to the examiners a competent knowledge of all computations.
- Candidates are also advised that the examiners attach considerable importance to the clarity with which answers are expressed.

#### 程序代票的数点公编程辅导

1. Efficiency of the decentralized equilibrium in a search economy

Consider the s Mortensen-Pissarides model. Suppose r > 0 and assume that firm the substantial discount the substantial discount and profits per unit time:

$$-(E(t) + V(t))c + b(1 - E(t))] dt.$$

Consider a social planner who chooses the path of V(t) to maximize W, subject to the constraint that  $\dot{E}(t) = M(1 - E(t), V(t)) - \lambda E(t)$ . The solution to this problem is the efficient allocation. Catting at an Multiple Spartial derivatives of M(U, V) with respect to U and V, respectively, the efficient allocation is then determined by the following first-order condition:

Assignment Project Exam Help  $e^{-rt} [y-c-b] = \mu(t) [M_U(1-E(t),V(t)) + \lambda] - \dot{\mu}(t)$ 

Email:  $\overset{ce^{-rt}/M_V(1)}{\text{cutores}} \overset{E(t)}{\text{obs}} \overset{V(t)}{\text{obs}} \overset{V(t)$ 

- (a) Using the first-order condition for the planner's problem, and imposing the steady state where E = V = 0 show that the equilibrium allocation will be constrained ficient when γ = 0 show that the equilibrium allocation will be constrained ficient when γ = 0 show that the equilibrium allocation will be constrained ficient when γ = 0 show that the equilibrium allocation will be constrained ficient when γ = 0 show that the equilibrium allocation will be constrained ficient when γ = 0 show that the equilibrium allocation will be constrained ficient when γ = 0 show that the equilibrium allocation will be constrained ficient when γ = 0 show that the equilibrium allocation will be constrained ficient when γ = 0 show that the equilibrium allocation will be constrained ficient when γ = 0 show that the equilibrium allocation will be constrained ficient when γ = 0 show that the equilibrium allocation will be constrained ficient when γ = 0 show that the equilibrium allocation will be constrained ficient when γ = 0 show that the equilibrium allocation will be constrained ficient when γ = 0 show that the equilibrium allocation will be constrained ficient when γ = 0 show that the equilibrium allocation will be constrained ficient when γ = 0 show that the equilibrium allocation will be constrained ficient when γ = 0 show that the equilibrium allocation will be constrained ficient when γ = 0 show that the equilibrium allocation will be constrained ficient when γ = 0 show that the equilibrium allocation will be constrained ficient when γ = 0 show that the equilibrium allocation will be constrained ficient when γ = 0 show that the equilibrium allocation will be constrained ficient when γ = 0 show that the equilibrium allocation will be constrained ficient when γ = 0 show that the equilibrium allocation when γ = 0 show that the equilibrium allocation when γ = 0 show that the equilibrium allocation when γ = 0 show that the equilibrium allocation when γ = 0 show that the equilibrium allocation when γ = 0 show that the e
- (b) Suppose the government imposes a tax  $T_v$  (or subsidy if  $T_v < 0$ ) on firms to post vacancies and rebates the revenue back to workers as a lump-sum T. That is, the firm's profits are now y w c if the job is filled and  $-c T_v$  if vacant. Workers receive w + T if employed and b + T if unemployed. Solve for the new equilibrium condition,  $rV_V(E) = 0$ . Find an expression for the optimal  $T_v$  (i.e., the value of  $T_v$  which shifts the equilibrium allocation to the efficient one). Explain and give economic intuition for what you find. (10 points)
- (c) Suppose there is an increase in y. How would the efficient level of employment respond? Can you tell what would happen to the optimal  $T_v$  from part (b)? Explain and give economic intuition for what you find. (10 points)
- (d) Assume k = 1,  $\gamma = 1/2$ , r = 0.05, b = 0.2, c = 0.5,  $\lambda = 0.3$ ,  $\phi = 0.25$ . Plot  $rV_V(E)$  against E with and without the optimal  $T_v$  for two scenarios: (i) y = 1 and (ii) y = 2. Report the value of  $T_v$  and the equilibrium E in each case. Explain what you find. (15 points)

# 

Consider the Barro tax-smoothing model. Suppose that output, Y, and the real interest rate, r > 0, are constant, and that the level of government debt outstanding at time 0 is  $D_0$  are two possible values of government purchases: either  $G_L$  or G. Assume distortion costs are quadratic.

(a) Suppose if  $G_t$  is no uncertainty in the path of government purchases. Spin  $G_t = G_H$  when t is even and  $G_t = G_L$  when t is odd. What  $G_t = G_L$  when  $G_t = G_L$ 

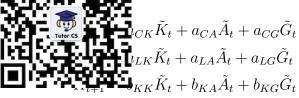

Now, for the rest of this question, suppose there is uncertainty over the path of government purchase,  $G_t$  ratificals till the FC she probability that  $G_{t+1} = G_H$  is  $p_L \in (0,1)$ . If  $G_t = G_H$ , the probability that  $G_{t+1} = G_L$  is  $p_H \in (0,1)$ .

- (b) Solve for the optimal rule for taxes  $T_t$  as a function of existing debt  $D_t$  and government purchases  $C_t$ . Give economic intuition for what you find. (20 points)
- (c) Assume  $G_L = 5$ ,  $G_H = 10$ , r = 0.04,  $p_L = 1/5$  and  $p_H = 1/10$ . Plot the path of taxes  $T_t$ , the primary deficition of  $G_t$  alternates with  $G_H$  over 60 periods, assuming that the realized path of  $G_t$  alternates with  $G_H$  for 10 periods, then  $G_L$  for 5 periods, starting with  $G_H$ . In other words,  $G_t = G_H$  for the first 10 periods,  $G_t = G_t$  for the next 10 periods, and so on. Give economic intuition for what you find. (10 points)
- (d) Suppose the rectized value of Groves Gg forever. What would happen to the path of government debt? Is the no-Ponzi game condition violated in this situation? Why or why not? (10 points)

Word limit for each question: 500 words

1. Solve the log-li her than the RBC model using the method of undetermined coefficients, where the log-likes the following form:

Assume  $\alpha = 1/3$ , g = 0.5%, n = 0.25%,  $\delta = 2.5\%$ ,  $(G/Y)^* = 0.2$ ,  $r^* = 1.5\%$ ,  $\ell^* = 1/3$ ,  $\rho_G = 0.25\%$ . Can at Extribution Casefully your solution technique and report the coefficients (a,b) for your solution. Then, trace out the impulse responses (over 60 periods) for capital, labor, consumption, output, the wage and the interest rate (a,b) for your solution. Then, trace out the impulse responses (over 60 periods) for capital, labor, consumption, output, the wage and the interest rate (a,b) for your solution. Then, trace out the impulse responses (over 60 periods) for capital, labor, consumption, output, the wage and the interest rate (a,b) for your solution. Then, trace out the impulse responses (over 60 periods) for capital, labor, consumption, output, the wage and the interest rate (a,b) for your solution. Then, trace out the impulse responses (over 60 periods) for capital, labor, consumption, output, the wage and the interest rate (a,b) for your solution. Then, trace out the impulse responses (over 60 periods) for capital, labor, consumption, output, the wage and the interest rate (a,b) for your solution.

2. Suppose that output is determined by the Lucas supply curve,  $y = y^n + b(\pi - \pi^e)$ . Moreover, suppose that social welfare is quadratic in both output and inflation. In other words, the social loss function 9476

 $L = \frac{1}{2}(y - y^*)^2 + \frac{1}{2}a(\pi - \pi^*)^2, \quad y^* > y^n, a > 0.$ 

Assume the policymaker operates under discretion and chooses inflation  $\pi$  to minimize L subject to the Lucas supply curve. Give economic interpretation for the parameters of this model, and show what happens to equilibrium social welfare when a falls. Give economic intuition for your answer. (25 points)

3. The average income of farmers is less than the average income of non-farmers, but fluctuates more from year to year. Given this, how does the permanent-income hypothesis predict that estimated consumption-income functions for farmers and non-farmers differ? Give economic intuition. (25 points)
